Annex 2 Carbon Reduction Path ............................................. 9
Annex 3 Carbon Compensation of Residual Emissions .................... 13
Glossary .......................................................................... 14
Reference .......................................................................... 15
1. Introduction

This Report aims to provide information on the carbon neutrality of the Lenovo product advertised as carbon neutral (hereinafter referred to as the “Product”) in Fiscal Year 2022/23\(^1\).

The Report will be updated annually in accordance with French Décret n° 2022-539 of 13 April 2022\(^2\) on carbon compensation and carbon neutrality claims in advertisements.

Lenovo declared to achieve carbon neutrality for the estimated sales volume for the Product. The Product’s carbon neutrality was certified.

2. Product Carbon Footprint

The product carbon footprint (PCF) calculation of the Product is conducted by using SimaPro and Ecoinvent Database, following IPCC 100-year Greenhouse Gas Emissions Assessment Method (IPCC 2021 GWP 100a), in accordance with ISO 14067:2018 *Greenhouse Gases – Carbon Footprint of Products – Requirements and Guidelines for Quantification*.

Detailed information of the PCF calculation and carbon reduction methods is provided in Annex 1 and Annex 2.

3. Carbon Reduction

Lenovo recognizes that human activities are contributing to climate change and concurs with the findings of current climate science as described in the latest assessment report from the Intergovernmental Panel on Climate Change (IPCC). Lenovo also recognizes that if left unchecked, current trends in climate change present serious economic and societal risks and agrees that specific actions are needed to stabilize atmospheric Greenhouse Gas (GHG) levels and hold global average temperatures to acceptable increases. Lenovo is working both internally and externally to help minimize and mitigate climate risks, and the commitment has been demonstrated by (detailed information can be found in [Lenovo Annual Environmental, Social and Governance (ESG) Report](#)):

- Implementing a corporate Climate and Energy Policy
- Executing a long-term comprehensive Climate Change Strategy
• Setting corporate-wide objectives and target which support the above Policy and Strategy\textsuperscript{3}

Detailed information of Lenovo’s carbon reduction path is provided in Annex 2.

**4. Compensation of Residual Emissions**

Lenovo has developed a stringent criterion to select carbon compensation programs for residual emission of the Product after carbon footprint reduction by environmentally conscious design.

Detailed information of the carbon compensation programs is provided in Annex 3.

\textsuperscript{3} 3.0 Environment, 2022/23 Environmental, Social and Governance Report
Annex 1 Product Carbon Footprint Evaluation

This Annex provides detailed information on the scope, functional unit, boundary, emission data and the methodological measures of the Product’s PCF.

Lenovo used life cycle assessment (LCA) methodology to perform the Product’s PCF calculation.

1.1 Scope
The Product was commercialized as SKUs (stock keeping unit) based on variation in the part configurations. The variation might result in difference in the PCF of different SKUs.

To ensure that Lenovo has fully achieved carbon neutrality for the Product, conservative approaches have been taken for PCF calculation.

1.2 Functional Unit
The PCF method relies on a “functional unit” (FU) for GHG emissions quantification. This Report defines the functional unit as the Product operating for 4 years.

1.3 System Boundaries
The system boundary considered in the PCF calculation was from cradle to grave, and the lifecycle stages included:

- Raw Material
- Manufacturing
- Distribution
- Use
- End of life

1.4 Cut-off Criteria
All inputs and outputs to a process have been included in the calculation for which data is available. The cut-off criteria were set that emission sources estimated to constitute less than 1% of the total PCF might be cut-off, and the total cut-offs constitute less than 5% of the total PCF.

1.5 Use and End-of-life phases and Associated Process
The Use phase assumed that the Product was used for 4 years by users from different regions. The user region assumption was from sales prediction. The Product energy consumption was tested in accordance with ENERGY STAR Program Requirements for Computers Version 8.0.
The data of End-of-life phase was in accordance with WEEE Directive 2012/19/EU, which included re-use, recycling, incineration and disposal.

1.6 Electricity Consumption Data
The electricity, tap water, natural gas and heat consumption through the lifecycle were considered, and Ecoinvent database was selected for calculation according to region, voltage level and gas pressure.

1.7 Geographical Scope
The Product (including subparts) was manufactured and assembled in Asia, distributed and used globally. Country-level or region-level emission factors were selected according to the locations where emissions occurred. When the factors were not available for a specific region or there was no specific location of emission sources, the global averages were selected.

1.8 PCF Result
The PCF of the Product is shown in the following table.
Table 3. PCF of the Product

---

4 The calculation was based on LCA methodology.

</tbody>
</table>

1.9 Verification

All the data sources, calculation modelling, background databases and the PCF of the Product have been verified by the certification authority of carbon neutrality.
Annex 2 Carbon Reduction Path

In 2020, Lenovo established science-based emissions reduction targets, which were validated by the Science Based Targets initiative (SBTi). Its Scope 1 and 2 emissions reduction targets are consistent with limiting warming to 1.5°C, and its Scope 3 emissions reduction targets meet ambitious criteria according to the SBTi’s methodology, which means they are in line with current best practices.

In 2023, Lenovo announced SBTi validated target to reach net-zero GHG emission by 2050. Lenovo’s net-zero target is to achieve a 90-percentage reduction across Scope 1, 2 and 3 emissions, and was the first PC and smartphone maker and one of the first 139 companies in the world to establish a net-zero target validated by SBTi5.

These targets have a base year of Fiscal Year6 (FY) 2018/19, near-term target year of FY 2029/30, and net-zero target year of FY 2049/50. The following table details the Company’s Science-Based Targets, road maps for their achievement, and progress against the targets in FY 2022/237,8.

Besides, Lenovo’s corporate-wide environmental standards and specifications require its product designers to consider environmentally conscious design practices. By encouraging recycling, minimizing resource consumption and
improving product energy efficiency, Lenovo aims to facilitate the carbon footprint reduction in its products.

The following environmentally conscious design has been introduced to the Product for carbon reduction.

Table 6. Environmentally Conscious Design in the Product

Annex 3 Carbon Compensation of Residual Emissions

Lenovo has developed internal *Guidance for Carbon Credits Purchases*, including following aspects to ensure the professionalism of suppliers and the integrity and effectiveness of carbon compensation programs:

- General requirements as Lenovo supplier
- Carbon credit trading experiences
- Mature and mainstream crediting mechanisms
- Traceability and transparency of carbon credit projects
- High-quality and industry-recognized project types
- Carbon credit retirement documents

The following table shows the source of carbon credits used in the Product.

Lenovo has offset the residual carbon emissions of the Product using carbon credits mentioned above based on its PCF, and the carbon compensation quantity and the retirement ID has been verified by the certification authority of carbon neutrality.

\(^9\) Carbon credit sellers: Profit Carbon Environmental Energy Technology (Shanghai) Co., Ltd.

\(^10\) CCER: Chinese Certified Emission Reduction
Glossary

Carbon neutrality: Referring to PAS 2060:2014 Specification for the Demonstration of Carbon Neutrality, is the state of being carbon neutral, i.e., condition in which during a specified period there has been no net increase in the global emission of greenhouse gases to the atmosphere as a result of the greenhouse gas emissions associated with the subject during the same period.

Scope 1 GHG emission: direct emissions from operations that are owned or controlled by Lenovo.

Scope 2 GHG emission: indirect emissions from the generation of purchased or acquired electricity, steam, heating or cooling consumed by Lenovo.

Scope 3 GHG emission: indirect emissions (not included in Scope 2) from Lenovo’s upstream and downstream value chain.
